## Data Sheet

## Description

The ACPL-P345/W345 contains an AIGaAs LED, which is optically coupled to an integrated circuit with a power output stage. This optocoupler is ideally suited for driving power and SiC(Silicon Carbide) MOSFETs used in inverter or AC-DC/DC-DC converter applications. The high operating voltage range of the output stage provides the drive voltages required by gate controlled devices. The voltage and high peak output current supplied by this optocoupler make it ideally suited for direct driving MOSFETs at high frequency for high efficiency conversion. The ACPLP345 and ACPL-W345 have the highest insulation voltage of $\mathrm{V}_{\text {IORM }}=891$ Vpeak and $\mathrm{V}_{\text {IORM }}=1140 \mathrm{~V}_{\text {peak }}$ respectively in the IEC/ EN/DIN EN 60747-5-5.

## Functional Diagram

Note: A $1 \mu \mathrm{~F}$ bypass capacitor must be connected between pins $\mathrm{V}_{\mathrm{CC}}$ and $V_{\mathrm{EE}}$.

## Truth Table

| LED | $\mathbf{V}_{\text {CC }}-\mathbf{V}_{\text {EE }}$ <br> "POSITIVE GOING" <br> (i.e., TURN-ON) | $\mathbf{V}_{\text {CC }}-\mathbf{V}_{\text {EE }}$ <br> "NEGATIVE GOING" <br> (i.e., TURN-OFF) | $\mathbf{V}_{\mathbf{0}}$ |
| :--- | :---: | :---: | :---: |
| OFF | $0-20 \mathrm{~V}$ | $0-20 \mathrm{~V}$ | LOW |
| ON | $0-8.1 \mathrm{~V}$ | $0-7.1 \mathrm{~V}$ | LOW |
| ON | $8.1-9.1 \mathrm{~V}$ | $7.1-8.1 \mathrm{~V}$ | TRANSITION |
| ON | $9.1-20 \mathrm{~V}$ | $8.1-20 \mathrm{~V}$ | HIGH |

## Features

- 1.0 A maximum peak output current
- 0.8 A minimum peak output current
- Rail-to-rail output voltage
- 120 ns maximum propagation delay
- 50 ns maximum propagation delay difference
- LED current input with hysteresis
- $50 \mathrm{kV} / \mu \mathrm{s}$ minimum Common Mode Rejection (CMR) at $\mathrm{V}_{\mathrm{CM}}=1500 \mathrm{~V}$
- $\mathrm{I}_{\mathrm{CC}}=4.0 \mathrm{~mA}$ maximum supply current
- Under Voltage Lock-Out protection (UVLO) with hysteresis
- Wide operating $\mathrm{V}_{\mathrm{CC}}$ Range: 10 to 20 V
- Industrial temperature range: $-40^{\circ} \mathrm{C}$ to $105^{\circ} \mathrm{C}$
- Safety Approval
- UL Recognized 3750/5000 VRMS for 1 min.
- CSA
- IEC/EN/DIN EN 60747-5-5 $\mathrm{V}_{\text {IORM }}=891 / 1140 \mathrm{~V}_{\text {peak }}$

## Applications

- Power and SiC MOSFET gate drive
- AC and Brushless DC motor drives
- Switching power supplies

## Ordering Information

ACPL-P345 is UL Recognized with 3750 V $_{\text {RMS }}$ for 1 minute per UL1577.
ACPL-W345 is UL Recognized with 5000 V $_{\text {RMS }}$ for 1 minute per UL1577.

| Part number | Option | Package | Surface Mount |  IEC/EN/DIN EN <br> Tape\& Reel $60747-5-5$ |  | Quantity |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| ACPL-P345 | -000E | $\begin{aligned} & \text { Stretched } \\ & \text { SO-6 } \end{aligned}$ | X |  |  | 100 per tube |
| ACPL-W345 | -500E |  | X | X |  | 1000 per reel |
|  | -060E |  | X |  | X | 100 per tube |
|  | -560E |  | X | X | X | 1000 per reel |

To order, choose a part number from the part number column and combine with the desired option from the option column to form an order entry.

Example 1:
ACPL-P345-560E to order product of Stretched SO-6 Surface Mount package in Tape and Reel packaging with IEC/EN/ DIN EN 60747-5-5 Safety Approval in RoHS compliant.

Example 2:
ACPL-W345-000E to order product of Stretched SO-6 Surface Mount package in Tube packaging and RoHS compliant. Option datasheets are available. Contact your Avago sales representative or authorized distributor for information.

## Package Outline Drawings

ACPL-P345 Stretched S0-6 Package (7 mm clearance)

## ACPL-W345 Stretched S0-6 Package (8 mm clearance)

## Recommended Pb-Free IR Profile

Recommended reflow condition as per JEDEC Standard, J-STD-020 (latest revision). Non- Halide Flux should be used.

## Regulatory Information

The ACPL-P345/W345 is approved by the following organizations:

| UL | Recognized under UL 1577, component recognition program up to $\mathrm{V}_{\mathrm{ISO}}=3750 \mathrm{~V}_{\text {RMS }}$ (ACPLP345) and $\mathrm{V}_{\text {ISO }}=5000 \mathrm{~V}_{\text {RMS }}$ (ACPL-W345). |

## Notes:

1. All Avago data sheets report the creepage and clearance inherent to the optocoupler component itself. These dimensions are needed as a starting point for the equipment designer when determining the circuit insulation requirements. However, once mounted on a printed circuit board, minimum creepage and clearance requirements must be met as specified for individual equipment standards. For creepage, the shortest distance path along the surface of a printed circuit board between the solder fillets of the input and output leads must be considered (the recommended Land Pattern does not necessarily meet the minimum creepage of the device).. There are recommended techniques such as grooves and ribs which may be used on a printed circuit board to achieve desired creepage and clearances. Creepage and clearance distances will also change depending on factors such as pollution degree and insulation level.

* The Input-Output Momentary Withstand Voltage is a dielectric voltage rating that should not be interpreted as an input-output continuous voltage rating. For the continuous voltage rating, refer to your equipment level safety specification or Avago Technologies Application Note 1074 entitled "Optocoupler Input-Output Endurance Voltage."

Notes:

1. Derate linearly above $85^{\circ} \mathrm{C}$ free-air temperature at a rate of $0.3 \mathrm{~mA} /{ }^{\circ} \mathrm{C}$.
2. Maximum pulse width $=10 \mu \mathrm{~s}$. This value is intended to allow for component tolerances for designs with lo peak minimum $=0.8 \mathrm{~A}$. See applications section for additional details on limiting Іон peak.
3. Derate linearly above $85^{\circ} \mathrm{C}$ free-air temperature at a rate of $12.5 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$.
4. Derate linearly above $85^{\circ} \mathrm{C}$ free-air temperature at a rate of $13.75 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$. The maximum LED junction temperature should not exceed $125^{\circ} \mathrm{C}$.
5. Maximum pulse width $=10 \mu \mathrm{~s}$.
6. In this test $\mathrm{V}_{\mathrm{OH}}$ is measured with a dc load current. When driving capacitive loads, $\mathrm{V}_{\mathrm{OH}}$ will approach $\mathrm{V}_{\mathrm{CC}}$ as $\mathrm{l}_{\mathrm{OH}}$ approaches zero amps.
7. Maximum pulse width $=1 \mathrm{~ms}$.
8. Pulse Width Distortion (PWD) is defined as $\left|t_{\text {PhL }}-t_{\text {pLH }}\right|$ for any given device.
9. The difference between tPHL and tPLH between any two ACPL-P345 parts under the same test condition.
10. $t_{\text {PSK }}$ is equal to the worst case diff erence in $t_{\text {PHL }}$ and/or $t_{\text {PLH }}$ that will be seen between units at any given temperature and specified test conditions.
11. Pin 2 needs to be connected to LED common. Split resistor network in the ratio $1.5: 1$ with $232 \Omega$ at the anode and $154 \Omega$ at the cathode.
12. Common mode transient immunity in the high state is the maximum tolerable $\mathrm{dV} \mathrm{V}_{\mathrm{CM}} / \mathrm{dt}$ of the common mode pulse, $\mathrm{V}_{\mathrm{CM}}$, to assure that the output will remain in the high state (i.e., $\mathrm{V}_{\mathrm{O}}>10.0 \mathrm{~V}$ ).
13. Common mode transient immunity in a low state is the maximum tolerable $\mathrm{d} \mathrm{V}_{\mathrm{CM}} / \mathrm{dt}$ of the common mode pulse, $\mathrm{V}_{\mathrm{CM}}$, to assure that the output will remain in a low state (i.e., $\mathrm{V}_{\mathrm{O}}<1.0 \mathrm{~V}$ ).
14. In accordance with UL1577, each optocoupler is proof tested by applying an insulation test voltage $\geq 4500 \mathrm{~V}_{\text {RMS }}$ for 1 second (leakage detection current limit, $I_{-O} \leq 5 \mu \mathrm{~A}$ ).
15. In accordance with UL1577, each optocoupler is proof tested by applying an insulation test voltage $\geq 6000 \mathrm{~V}_{\text {RMS }}$ for 1 second (leakage detection current limit, $I_{-O} \leq 5 \mu \mathrm{~A}$ ).
16. Device considered a two-terminal device: pins 1,2 , and 3 shorted together and pins 4,5 and 6 shorted together.
17. The device was mounted on a high conductivity test board as per JEDEC 51-7.

## Application Information

## Product Overview Description

The ACPL-P345/W345 is an optically isolated power output stage capable of driving power or SiC . Based on BCDMOS technology, this gate drive optocoupler delivers higher peak output current, better rail-to-rail output voltage performance and two times faster speed than the previous generation products.
The high peak output current and short propagation delay are needed for fast MOSFET switching to reduce dead time and improve system overall efficiency. Rail-to-rail output voltage ensures that the MOSFET's gate voltage is driven to the optimum intended level with no power loss across the MOSFET. This helps the designer lower the system power which is suitable for bootstrap power supply operation.

It has very high CMR(common mode rejection) rating which allows the microcontroller and the MOSFET to operate at very large common mode noise found in industrial motor drives and other power switching applications. The input is driven by direct LED current and has a hysteresis that prevents output oscillation if insufficient LED driving current is applied. This will eliminates the need of additional Schmitt trigger circuit at the input LED.
The stretched SO6 package which is up to $50 \%$ smaller than conventional DIP package facilitates smaller and more compact design. These stretched packages are compliant to many industrial safety standards such as IEC/EN/ DIN EN 60747-5-5, UL 1577 and CSA.

## Recommended Application Circuit

The recommended application circuit shown in Figure 16 illustrates a typical gate drive implementation using the ACPL-P345.

The supply bypass capacitors ( $1 \mu \mathrm{~F}$ ) provide the large transient currents necessary during a switching transition. Because of the transient nature of the charging currents, a low current ( 4.0 mA ) power supply will be enough to power the device. The split resistors (in the ratio of 1.5:1) across the LED will provide a high CMR response by providing a balanced resistance network across the LED.

The gate resistor $\mathrm{R}_{\mathrm{G}}$ serves to limit gate charge current and controls the MOSFET switching times.
In PC board design, care should be taken to avoid routing the MOSFET drain or source traces close to the ACPL-P345 input as this can result in unwanted coupling of transient signals into ACPL-P345 and degrade performance.

## Selecting the Gate Resistor (Rg)

Calculate Rg minimum from the IOL peak specification. The MOSFET and Rg in Figure 16 can be analyzed as a simple RC circuit with a voltage supplied by ACPL-P345/ W345.

$$
\begin{aligned}
& R g \geq \frac{V_{C C}-V_{E E}}{I_{\text {OLPEAK }}} \\
& =\frac{10-0 \mathrm{~V}}{1 \mathrm{~A}} \\
& =10 \Omega
\end{aligned}
$$

The external gate resistor, Rg will ensure the output current will not exceed the device absolute maximum rating of 1 A.

## LED Drive Circuit Considerations for High CMR Performance

Figure 17 shows the recommended drive circuit for the ACPL-P345/W345 that gives optimum common-mode rejection. The two current setting resistors balance the common mode impedances at the LED's anode and cathode. Common-mode transients can be capacitive coupled from the LED anode, through CLA (or cathode through $C_{L C}$ ) to the output-side ground causing current to be shunted away from the LED (which is not wanted when the LED should be on) or conversely cause current to be injected into the LED (which is not wanted when the LED should be off).

Figure 17. Recommended high-CMR drive circuit for the ACPL-P345/W345.

Table 8 shows the directions of LLP and $\mathrm{I}_{\text {LN }}$ depend on the polarity of the common-mode transient. For transients occurring when the LED is on, common-mode rejection ( $\mathrm{CM}_{\mathrm{H}}$, since the output is at "high" state) depends on LED current $\left(\mathrm{I}_{\mathrm{F}}\right)$. For conditions where $\mathrm{I}_{\mathrm{F}}$ is close to the switching threshold ( $\mathrm{I}_{\mathrm{FLH}}$ ), $\mathrm{CM}_{\mathrm{H}}$ also depends on the extent to which ILP and ILN balance each other. In other words, any condition where a common-mode transient causes a momentary decrease in $I_{F}$ (i.e. when $d V_{C M} / d t>0$ and $\left|I_{L P}\right|>$ $|\mathrm{LLN}|$, referring to Table 8) will cause a common-mode failure for transients which are fast enough.
Likewise for a common-mode transient that occurs when the LED is off (i.e. $C M_{\mathrm{L}}$, since the output is at "low" state), if an imbalance between $I_{L P}$ and $I_{\text {LN }}$ results in a transient IF equal to or greater than the switching threshold of the optocoupler, the transient "signal" may cause the output to spike above 1 V , which constitutes a $C M_{\mathrm{L}}$ failure. The balanced lled-setting resistors help equalize the common mode voltage change at the anode and cathode. The shunt drive input circuit will also help to achieve high $\mathrm{CM}_{\mathrm{L}}$ performance by shunting the LED in the off state.

Table 8. Common Mode Pulse Polarity and LED current Transients

| dV $\mathrm{CM}^{\text {/ }} \mathrm{dt}$ | $\mathrm{l}_{\text {LP }}$ Direction | $\mathrm{l}_{\text {LP }}$ Direction | If $\left\|\mathrm{L}_{\mathrm{LP}}\right\|<\left\|\mathrm{I}_{\mathrm{LN}}\right\|$, $I_{F}$ is momentarily | If $\left\|\mathrm{L}_{\mathrm{L} P}\right\|>\left\|\mathrm{I}_{\mathrm{LN}}\right\|$, $I_{F}$ is momentarily |
| :---: | :---: | :---: | :---: | :---: |
| Positive ( $>0$ ) | Away from LED anode through C LA | Away from LED cathode through CLC | Increase | Decrease |
| Negative(<0) | Toward LED anode through CLA | Toward LED cathode through CLC | Decrease | Increase |

## Dead Time and Propagation Delay Specifications

The ACPL-P345/W345 includes a Propagation Delay Difference (PDD) specification intended to help designers minimize "dead time" in their power inverter designs. Dead time is the time period during which both the high and low side power transistors (Q1 and Q2 in Figure 16) are off. Any overlap in Q1 and Q2 conduction will result in large currents flowing through the power devices between the high and low voltage motor rails.

To minimize dead time in a given design, the turn on of LED2 should be delayed (relative to the turn off of LED1) so that under worst-case conditions, transistor Q1 has just turned off when transistor Q2 turns on, as shown in Figure 18. The amount of delay necessary to achieve this condition is equal to the maximum value of the propagation delay difference specification, PDD $_{\text {MAX }}$, which is specified to be 100 ns over the operating temperature range of 40 ${ }^{\circ} \mathrm{C}$ to $105^{\circ} \mathrm{C}$.

Delaying the LED signal by the maximum propagation delay difference ensures that the minimum dead time is zero, but it does not tell a designer what the maximum dead time will be. The maximum dead time is equivalent to the difference between the maximum and minimum propagation delay difference specifications as shown in Figure 19. The maximum dead time for the ACPL-P345/ W345 is $100 \mathrm{~ns}(=50 \mathrm{~ns}-(-50 \mathrm{~ns})$ ) over an operating temperature range of $-40^{\circ} \mathrm{C}$ to $105^{\circ} \mathrm{C}$.

Note that the propagation delays used to calculate PDD and dead time are taken at equal temperatures and test conditions since the optocouplers under consideration are typically mounted in close proximity to each other and are switching identical MOSFETs.

## LED Current Input with Hysteresis

The detector has optical receiver input stage with built in Schmitt trigger to provide logic compatible waveforms, eliminating the need for additional wave shaping. The hysteresis (Figure 6) provides differential mode noise immunity and minimizes the potential for output signal chatter.

*PDD = Propagation Delay Difference
Note: for PDD calculations the propagation delays Are taken at the same temperature and test conditions.
Figure 18. Minimum LED skew for zero dead time

*PDD = Propagation Delay Difference
Note: For Dead Time and PDD calculations all propagation delays are taken at the same temperature and test conditions.
Figure 19. Waveforms for dead time

## Thermal Model for ACPL-P345/W345 Stretched S06 Package Optocoupler

## Definitions:

$\mathrm{R}_{11}$ : Junction to Ambient Thermal Resistance of LED due to heating of LED
$\mathrm{R}_{12}$ : Junction to Ambient Thermal Resistance of LED due to heating of Detector (Output IC)
$\mathrm{R}_{21}$ : Junction to Ambient Thermal Resistance of Detector (Output IC) due to heating of LED.
$\mathrm{R}_{22}$ : Junction to Ambient Thermal Resistance of Detector (Output IC) due to heating of Detector (Output IC).
$P_{1}$ : Power dissipation of LED (W).
$\mathrm{P}_{2}$ : Power dissipation of Detector / Output IC (W).
$\mathrm{T}_{1}$ : Junction temperature of LED $\left({ }^{\circ} \mathrm{C}\right)$.
$\mathrm{T}_{2}$ : Junction temperature of Detector $\left({ }^{\circ} \mathrm{C}\right)$.
Ta: Ambient temperature.
Ambient Temperature: Junction to Ambient Thermal Resistances were measured approximately 1.25 cm above optocoupler at $\sim 23^{\circ} \mathrm{C}$ in still air

| Thermal Resistance | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| :--- | :---: |
| $\mathrm{R}_{11}$ | 135 |
| $\mathrm{R}_{12}$ | 27 |
| $\mathrm{R}_{21}$ | 39 |
| $\mathrm{R}_{22}$ | 47 |

This thermal model assumes that an 6-pin single-channel plastic package optocoupler is soldered into a $7.62 \mathrm{~cm} x$ 7.62 cm printed circuit board (PCB) per JEDEC standards. The temperature at the LED and Detector junctions of the optocoupler can be calculated using the equations below.
$\mathrm{T}_{1}=\left(\mathrm{R}_{11} * \mathrm{P}_{1}+\mathrm{R}_{12} * \mathrm{P}_{2}\right)+\mathrm{Ta}-$ (1)
$T_{2}=\left(R_{21} * P_{1}+R_{22} * P_{2}\right)+T a--(2)$
Using the given thermal resistances and thermal model formula in this datasheet, we can calculate the junction temperature for both LED and the output detector. Both junction temperatures should be within the absolute maximum rating.

## О компании

ООО "ТрейдЭлектроникс" - это оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов. Реализуемая нашей компанией продукция насчитывает более полумиллиона наименований.

Благодаря этому наша компания предлагает к поставке практически не ограниченный ассортимент компонентов как оптовыми, мелкооптовыми партиями, так и в розницу.

Наличие собственной эффективной системы логистики обеспечивает надежную поставку продукции по конкурентным ценам в точно указанные сроки.

Срок поставки со стоков в Европе и Америке - от 3 до 14 дней.
Срок поставки из Азии - от 10 дней.
Благодаря развитой сети поставщиков, помогаем в поиске и приобретении экзотичных или снятых с производства компонентов.

Предоставляем спец цены на элементы для создания инженерных сэмплов.

## Упорный труд, качественный результат дают нам право быть уверенными в себе и надежными для наших клиентов.

## Наша компания это:

Гарантия качества поставляемой продукции
Широкий ассортимент
Минимальные сроки поставок
Техническая поддержка
Подбор комплектации
Индивидуальный подход
Гибкое ценообразование
Наша организация особенно сильна в поставках модулей, микросхем, пассивных компонентов, ксайленсах (XC), EPF, EPM и силовой электроники.

Большой выбор предлагаемой продукции, различные виды оплаты и доставки, позволят Вам сэкономить время и получить максимум выгоды от сотрудничества с нами!

## Trade Electronics.ru

гарантия бесперебойности производства и качества выпускаемой продукции

С удовольствием будем прорабатывать для Вас поставки всех необходимых компонентов по текущим запросам для скорейшего выявления групп элементов, по которым сотрудничество именно с нашей компанией будет для Вас максимально выгодным!

С уважением,
Менеджер отдела продаж ООО
«Трейд Электроникс»
Шишлаков Евгений
